Chordae Tendineae. The chordae
tendineae are fibrous tendon like
cords that connect to the

tricuspid valve in the right ventricle and the mitral valve in the left ventricle. When the valves close the chordae tendineae prevent the cusps from swinging upwards into the atrial cavity.

The introduction of non-fluoroscopic electroanatomic mapping technologies has enabled electrophysiologists to interpret correctly the gross morphology and attitudinal position of the cardiac chambers during the course of a mapping procedure.¹ Intracardiac echocardiography has also been used to visualise some endocardial structures such as the oval fossa (OF) or terminal crest (TC) and to monitor the effects of ablation.

Cardiac conduction is the rate at which the heart conducts electrical impulses. Heart nodes and nerve fibers play an important role in causing the heart to contract. Atrioventricular Bundle: A bundle of fibers that carry cardiac impulses. Atrioventricular Node: A section of nodal tissue that delays and relays cardiac impulses.

The coronary sinus drains the great cardiac vein and the middle cardiac vein as well as other small veins . The cardiac veins might be used for catheter ablation of ventricular premature contractions or ventricular tachycardias.
