Elementary Differential Geometry, Revised 2nd Edition ...

The geometrical study of a surface M in Euclidean space R^3 separates into three distinct categories: the intrinsic geometry of M , the shape of M in R^3 , and the Euclidean geometry of R^3 . Geometry of R^3 is based on the dot product and consists of those concepts preserved by the isometries of R^3 . The chapter emphasizes that the geometry of M is also based on the dot product—applied only to vectors tangent to M —and that it consists of those features preserved by the isometries of M .

This course is an introduction to differential geometry, which can be described as studying the geometric properties of a curved space using calculus. The focus will be on the geometry of curves and surfaces in 3-space but with an eye on how to extend the concepts to abstract geometric spaces. After building the foundations of the subject, specific topics to be covered include the Gauss-Bonnet theorem, which links the differential geometric properties of a surface to its topological ...

This book is an exposition of semi-Riemannian geometry (also called pseudo-Riemannian geometry)--the study of a smooth manifold furnished with a metric tensor of arbitrary signature. The principal special cases are Riemannian geometry, where the metric is positive definite, and Lorentz geometry. For many years these two geometries have developed almost independently: Riemannian geometry ...
