each group element the trace of the corresponding matrix. The character carries the essential information about the representation in a more condensed form. Georg Frobenius initially developed representation theory of finite groups entirely based on the characters, and without any explicit matrix realization of representations themselves. This is possible becau

Character theory provides a powerful tool for proving theorems about finite groups. In addition to dealing with techniques for applying characters to "pure" group theory, a large part of this book is devoted to the properties of the characters themselves and how these properties reflect and are reflected in the structure of the group.

Character theory is a powerful tool for understanding finite groups. In particular, the theory has been a key ingredient in the classification of finite simple groups. Characters are also of interest in their own right, and their properties are closely related to properties of the structure of the underlying group.

Through the fundamental work of Deligne and Lusztig in the 1970s, further developed mainly by Lusztig, the character theory of reductive groups over finite fields has grown into a rich and vast area of mathematics. It incorporates tools and methods from algebraic geometry, topology, combinatorics and computer algebra, and has since evolved substantially.

A linear representation of a finite group is a group homomorphism:  $\rho: G \rightarrow \text{GL}(V)$ . Here  $\text{GL}(V)$  is notation for a general linear group, and  $\text{Aut}(V)$  for an automorphism group.

The character:  $\chi$  of a representation  $\rho$  of a group  $G$  on a finite-dimensional vector space  $V$  over a field  $F$  is the trace of the representation  $\rho$ , i.e.  $\chi(g) = \text{tr}(\rho(g))$  for  $g \in G$ . In general, the trace is not a group homomorphism, nor does the set of traces form a group [citation needed]. The characters of one-dimensional representations are identical to one-dimensional representations, so the above ...

*Character (mathematics) - Wikipedia*

In mathematics, a character group is the group of representations of a group by complex-valued functions. These functions can be thought of as one-dimensional matrix representations and so are special cases of the group characters that arise in the related context of character theory. Whenever a group is represented by matrices, the function defined by the trace of the matrices is called a

Character theory provides a powerful tool for proving theorems about finite groups. In fact.. there are some important results, such as Frobenius' theorem, for which no proof without characters is known. (Until fairly recently the Burnside's  $p^q r$  theorem was another outstanding example of this.)
