Particulate matter (PM): diesel down 96% since 1993
Because petrol and diesel engines produce different types of emissions they are subject to different standards. Diesel, for example, produces more particulate matter - or soot - leading to the introduction of diesel particulate filters (DPFs).

The diesel engine, named after Rudolf Diesel, is an internal combustion engine in which ignition of the fuel is caused by the elevated temperature of the air in the cylinder due to the mechanical compression (adiabatic compression); thus, the diesel engine is a so-called compression-ignition engine (CI engine). This contrasts with engines using spark plug-ignition of the air-fuel mixture, such ...

Emission Control in Marine Diesel Engines

One of the first-developed exhaust emission control systems is secondary air injection. Originally, this system was used to inject air into the engine's exhaust ports to provide oxygen so unburned and partially burned hydrocarbons in the exhaust would finish burning.
