increasingly contested in nearly all parts of the world. Available freshwater supplies have declined nearly 40% since 1970, and the UN predicts that, by 2025, 1.8 billion people will not have sufficient water to meet all of their daily needs. Water conflict is essentially a political problem because it reflects normative disagreements about who has the authority to define its value and appropriate uses.

On Wednesday, February 20, 2019, the Strauss Center welcomed Scott Moore, the Director of the Penn Global China Program at the University of Pennsylvania, for a talk on "Hydropolitics in China: Water Conflict, Development, and Sustainability in a Rising Power." Drawing on new book, Subnational Hydropolitics, this talk explored the role that water has played in Chinese politics, its rapid economic growth, and its struggle to make its development sustainable.

"It's often claimed that future wars will be fought over water. But while international water conflict is rare, it's common between sub-national jurisdictions like states and provinces. Drawing on cases in the United States, China, India, and France, this book explains why these sub-national water conflicts occur - and how they can be prevented"--

What is the one thing that no one can do without? Water. Where water crosses boundaries — be they economic, legal, political or cultural — the stage is set for disputes between different users trying to safeguard access to a vital resource, while protecting the natural environment. Without strategies to anticipate, address, and mediate between competing users, intractable water conflicts are likely to become more frequent,

more intense, and more disruptive around the world. In this book, Delli Priscoli and Wolf investigate the dynamics of water conflict and conflict resolution, from the local to the international. They explore the inexorable links between three facets of conflict management and transformation: Alternative Dispute Resolution (ADR), public participation, and institutional capacity. This practical guide will be invaluable to water management professionals, as well as to researchers and students in engineering, economics, geography, geology, and political science who are involved in any aspects of water management.

Explores the complex political and programmatic reasons why government officials in Third World countries often wilfully

adopt wasteful natural resource policies. Drawing on 16 case studies from Africa, Asia and Latin America, the author documents how clashes among government agencies have led to results ranging from Indonesia's deforestation to the collapse of the Mexican water system, from the destruction of cocoa farms in Ghana to the waste of Nigeria's oil wealth.

Bridges over Water places the study of transboundary water conflicts, negotiation, and cooperation in the context of various disciplines, such as international relations, international law, international negotiations, and economics. It demonstrates their application, using various quantitative approaches, such as river basin modeling, quantitative negotiation theory, and game theory. Case-studies of

particular transboundary river basins, lakes, and aquifers are also considered. This second edition updates the literature on international water and in-depth analyses on political developments and cooperation between riparian states. With an appended chapter on principles and practices of negotiation, and a new case study on the La Plata Basin, this edition is a timely update to the field of transboundary water studies.

This book provides the first comprehensive assessment of the various issues faced by countries in the European Union, where progressing climate change and urbanization pose significant cooperative challenges in a large number of river basins. Conducting a thorough analysis of the intricate web of

EU water governance, it reveals that the hydropolitical stability of the European Union is already at risk. Further, given the structural nature of the shortcomings in EU water policy—e.g. the rigidity of the EU's founding treaties or the institutional complacency of the European Commission—the book argues that these risks are likely to turn into sources of prolonged conflict, unless EU decision-making bodies take steps to address the new hydrological realities early on.

Is there enough water on this planet for a global population that will shortly double its present size? The answer is of huge importance for people everywhere, but particularly to the peoples and political leaders of the Middle East and North Africa. As well as explaining the particular issues of conflict in

the region, Allan argues that the answer to these problems lies at the global rather than local level. The Middle East Water Question is a major book by one of the world's leading authorities on water issues.

With more than 50 percent of the world's landmass covered by river basins shared by two or more states, competition over water resources has always had the potential to spark violence. And growing populations and accelerating demands for fresh water are putting ever greater pressures on already scarce water resources. In this wide-ranging study, Arun Elhance explores the hydropolitics of six of the world's largest river basins. In each case, Elhance examines the basin's physical, economic, and political geography; the possibilities

for acute conflict; and efforts to develop bilateral and multilateral agreements for sharing water resources. The case studies lead to some sobering conclusions about impediments to cooperation but also to some encouraging ones--among them, that it may not be possible for Third World states to solve their water problems by going to war, and that eventually even the strongest riparian states are compelled to seek cooperation with their weaker neighbors.

This volume explores the role of water in the Middle East's current economic, political and environmental transformations, which are set to continue in the near future. In addition to examining water conflict from within the domestic contexts of Iraq, Yemen and Syria-- all experiencing

high levels of instability today--the contributors shed further light on how conflict over water resources has influenced political relations in the region. They interrogate how competition over water resources may precipitate or affect war in the Middle East, and assess whether or how resource vulnerability impacts fragile states and societies in the region and beyond. *Water and Conflict in the Middle East* is an essential contribution to our understanding of turbulence in this globally significant region.

China's Hydro-politics in the Mekong explores the intricate processes of conflict and cooperation over the use of water resources in the Mekong river basin between upstream China and the downstream countries of Laos, Thailand, Cambodia,

and Vietnam. The book tackles two gaps in the empirical literature: first, the neglect of international hydro-politics as one specific and increasingly important issue area of China's foreign policy behavior, especially its neighborhood diplomacy; and second, the disregard of China's role in Mekong River politics. In particular, this book scrutinizes the "spring 2010 Mekong crisis" and the events surrounding it which led to a series of complex multi-level, security-related interactions among various state and non-state actors in the region, with China at the center. Analyzing this crisis, the book not only employs securitization theory as its theoretical framework and adds a couple of innovations to this theory, but also gives a detailed account of China's hydro-political behavior in one specific and particularly revealing case study.

Moreover, the book embeds China's Mekong hydro-politics in the bigger picture of its (sub-)regional international affairs, as the former does not take place in a vacuum, but rather is a part of China's overall foreign relations with its neighbors. The book acknowledges this link and provides new insights into the role of hydro-politics and its relationship vis-à-vis other issue areas of China's foreign policy.
