What is Left Ventricular Failure?

Acute left ventricular (LV) dysfunction is the leading cause of death in patients hospitalized for ST elevation acute myocardial infarction (STEMI). 1 Reperfusion therapy, either fibrinolysis or emergency mechanical reperfusion with primary percutaneous intervention (PCI), has been developed to relieve myocardial ischemia and maintain myocyte integrity and function, increasing the salvage of threatened myocardium and thereby preserving ventricular function. Compared with fibrinolysis ...

Acute pulmonary oedema (p. 236) is most often due to increased pulmonary capillary hydrostatic pressure secondary to acute left ventricular failure (LVF), and relatively rarely to other causes such as increased capillary permeability as in bacteraemic shock or inhalation of toxic fumes. If the cause is not LVF, then the most suitable treatment when the condition is severe and the patient hypoxic, is usually intubation and artificial ventilation.
