The non-parametric kinetics (NPK) method of kinetic analysis, proposed by Serra et al. . . is an interesting example of a "model-free" method that uses a system of submatrices derived from a set of non-isothermal experiments at different heating rates, to find the Arrhenius parameters, without any prior knowledge of the conversion function. Although, the method is rather complicated and time-consuming, and hence may not gain widespread use, it raises some interesting aspects of the ...

"Model-free" kinetic analysis? - ScienceDirect  
Model-free analysis: There is no assumption of the reaction type. Model-free analysis allows for determination of the activation energy of a reaction process without assuming a kinetic model for the process. Also, the reaction type is usually not required to calculate the activation energy. However, it is not possible to determine the number of reaction steps, their contribution to the total effect or the order in which they occur.
