Example can be easily understood with the help of a case study. Assume, a video library

maintains a database of movies rented out.

Without any normalization, all information is stored in one table as shown below.

Normalization –  
Exercises

Normalization is a  
technique for producing

a set of tables with desirable properties that support the requirements of a user or company. Major aim of relational database design is to group columns into tables to minimize data redundancy and reduce file storage space required by base tables. Take a look at the following example:

Database normalization  
or SQL normalization  
helps us to group related  
data in one single table.

Any attributive data or  
indirectly related data  
are put in different  
tables and these tables  
are connected with a  
logical relationship  
between parent and  
child tables. In 1970,

Edgar F. Codd came up

## BCNF in Database Normalization ...

The first normal form is the normal form of database where data must not contain repeating groups. The database is in First normal form if, 1. It contains only atomic values. Atomic values:- The Single cell have only single value. 2. Each Record needs to
