Petropedia explains Open Hole Logging. Well logging procedure is a technique of analyzing and collecting data of an oil well by using logging tools in the borehole. There are two types of well logging – Open Hole Logging and Cased-hole logging. Open Hole Logging is done when a borehole is penetrated by an open hole log before casing or cementing the wellbore while Cased-hole logging refers to the logging that is done after the wellbore has been cased.

Open hole logging devices are used to characterize subsurface formations. Common formation attributes that may be characterized include. Storage capacity of the formation, which normally includes porosity and fluid saturations. Fluid properties, which include density, gas to oil ratio, API gravity, water resistivity and salinity, temperature, and pressure.
