Energy Conservation Conservation of Energy.  
In a closed system, where no energy is added and none can escape, the total energy in that system must remain constant. When energy is converted from one form to another, the total energy before the change has to equal the total of all energies after the change. It is not possible to create or destroy energy.

Notes: Energy is a conserved quantity: it can change forms and be transferred from one place to another, but it cannot be created or destroyed. For a process where energy changes forms or gets transferred, we can say that total energy before the process is equal to total energy after, or.  $E_i = E_f$ .

According to the law of energy conservation:  
Energy can neither be created nor destroyed;  
however it can be converted from one form of  
energy to the other. Also, we know that  
energy is conserved in elastic collision.

Obviously, a loss in energy during a collision will imply that the collision was inelastic.

## ~~Experiment to Study Conservation of Energy~~

The law of conservation of energy is a very important law in thermodynamics study in Physics. According to it energy can neither be created nor be destroyed. But we may transform it from one form to another. If we take all forms of energy into consideration, then the total energy of an isolated system always remains constant.

Conservation of Energy in the motion of simple pendulum. In a simple pendulum with no friction, mechanical energy is conserved.

When a simple pendulum oscillates with simple harmonic motion, it gains some kinetic energy because of this type of motion. As the pendulum swings back and forth, there is a constant exchange between kinetic energy and gravitational potential energy.
