Piping constitutes 25% to 35% of the material of a process plant, requires 30% to 40% of the erection labor, and consumes 40% to 48% of the engineering man-hours. The actual importance of piping, however, can far exceed these percentages. An entire piping system is composed of a large number of components.

The stress is caused by the pipe pushing against some fixed restraint. Thermal stresses are "secondary stresses" because they are self-limiting. That is, yielding or deformation of the part reduces the stress. Higher stresses are allowed than in the primary case because of this self limiting behavior.
