To put this in perspective, if you're playing poker at your local casino and are dealt 30 hands per hour, you can expect to receive pocket Aces an average of once every 7.5 hours. The odds of receiving any of the thirteen possible pocket pairs (twos up to Aces) is: $(13/221) = (1/17) \approx 5.9\%$.

balls in urns. The author uses students' natural interest in poker to teach important concepts in probability.

For decades, the highest level of poker have been dominated by players who have learned the game by playing it, 'road gamblers' who have cultivated intuition for the game and are adept at reading other players' hands from betting patterns and physical tells. Over the last five to ten years, a whole new breed has risen to prominence within the poker community. Applying the tools of computer science and mathematics to poker and sharing the information across the Internet, these

probability and set theory notions is helpful. In most cases, you'll need some college math to follow the formulas here, but this is not a requirement, because the numerical results are collected in tables at the end of each section. The work is packed with formulas, algorithms and tables. Its' primary goal is to allow the reader to quickly find the odds for their hand and for their opponent's hand, in order to improve his/her betting decisions. Every type of card distribution is tabulated in a logical, consistent and comprehensive manner. The complete methodology and all the calculations are shown, so it teaches the player how to calculate probability for any situation for every stage of the game, even for other card games. You will find here the real odds, returned by precise
