A problem-oriented-language is a language tailored to a particular application. To avoid that uniquely clumsy term, I'll usually substitute application language as synonymous. Very often such a language isn't recognised for what it is. For instance, if your program reads a code in column 80 to identify an input card, you are implementing an

Good question. The best answer I can think of would be problem oriented programming concentrates on acting on the data structure as a basis to write code for an app (think tables) and procedure oriented programming strictly requires utilizing hierarchical approach to the data, because the language itself is hierarchical.

What is difference between Problem oriented and Procedure ...

Procedural programming is a programming paradigm, derived from structured programming, [citation needed] based on the concept of the procedure call Procedures (a type of routine or subroutine) simply contain a series of computational steps to be carried out. Any given procedure might be called at any point during a program's execution, including by other procedures or itself.

Programming a Problem-Oriented Language — Raspberry Alpha ...

The problem with object-oriented languages is they've got all this implicit environment that they carry around with them. You wanted a banana but what you got was a gorilla holding the banana and the entire jungle. That pretty much says it all. It's fine to reuse classes; in fact, it can be a major virtue of object-oriented programming.

Language-oriented programming (LOP) is a software-development paradigm where "language" is a software building block with the same status as objects, modules and components, and rather than solving problems in general-purpose programming languages, the programmer creates one or more domain-specific languages for the problem first, and solves the problem in those languages. Language-oriented programming was first described in detail in Martin Ward's 1994 paper Language Oriented Programming, publi
