Soil construction is important for construction purposes and there are many types of soil construction that are taken into account prior to construction. Prior to construction whether or not a soil is suitable for construction purposes is taken into account and once this is done, suitable measures are carried out to modify or correct anything that needs to be fixed.

### Types Of Soil Construction | Types Of

Since the four basic soil components are gravel, sand, silt and clay, the Construction Supervisor can determine if the soil is mostly gravel or sand or a clay/silt just by looking at it. The next important soil classification regards cohesion. A cohesive soil sticks together, it has strong bonds between the individual soil particles.

### Soils & Geology in Construction from Construction ...

1) All soil is vulnerable to erosion. And during the construction process, soil becomes loose and loses its stability. To help

decrease any problems caused by erosion, one method is limiting the space where the soil is moved around during the excavation process, explained in Site Engineering for Landscape Architects.
